Concerned about your detention project’s schedule and budget?

Manage risk with the TrussWall® Cell System

The TrussWall® Cell System provides a complete security envelope with Trussbilt’s industry-leading integrated products, offering near-turnkey efficiency for your project’s security requirements. Trussbilt and its business partners handle design, engineering, offsite production, MEP coordination, installation, finish painting, glazing, locks and hardware. TrussWall can be delivered in weeks, compared to months with other systems, and is compact and easy to store.

From design through product installation, Trussbilt solves your most serious challenges with keeping your project on-track and on-budget.

A flexible installation approach minimizes weather delays.

The TrussWall Cell System can be installed:

- On a slab before the superstructure is erected
- After the superstructure is erected but before the building is enclosed
- After the building is enclosed and protected from the weather

- Wall installation sequence allows MEP trades to work in an open environment.
- Trussbilt-certified installers ensure system integrity and the manufacturer’s warranty for the facility owner.

Installation timing flexibility and improved working conditions give the GC and other team members the best opportunity to shorten the schedule and lower risks. Cells are off the critical path! (cont’d on back)
Flexible design meets your project’s unique needs.

The TrussWall Cell System’s space-saving design achieves ASTM’s highest security level while reducing space requirements, resulting in a smaller footprint or allowing more cells in the same space.

Structural requirements for high rises, cells over a basement, and cells on second level or higher are reduced – TrussWall is 1/3 the weight of concrete.

Project going over budget?

The TrussWall Cell System’s production efficiencies, flexible installation approach, and space and weight-saving design features mean lower general conditions. Costs go down for all team members – the owner, GCs, and other trades.

For further information, or to request a video of the TrussWall Cell System installation process, contact Brad Schotzko at 651.789.7080.
